- Positions 1 and 2 describe the channel service code in an encoded form. The channel service code will typically be specified as the service code of the special service circuit or the transmission grade of the message trunk circuit. (2 alpha or 2 alpha/numeric characters).
- Positions 3 and 4 represent the option codes available for each channel service code. Standard combinations of this code will allow the customer to enhance the technical performance of the requested channel, or to further identify the type of service. It is also used to specify options such as conditioning, effective 4-wire, multiplexing, etc. (2 alpha or 2 alpha/numeric characters).

NOTES:

1. RPON appears 1 time on the LSR.
2. RPON may be used to relate orders that have the same due date and are associated with the same end user at the same or different locations.
3. The first PON will have NOR of 01xx with the RPON not populated. PONs 02-99 will have a NOR of 02xx or greater with the RPON field containing the first PON. For example if PON one was named Kevin, Kevin would be in the RPON field for PONs 2-99.
4. AT&T will use both the NOR field and the RPON field. The RPON field of the first order in a series will contain no value. For example, the NOR field will contain the value of 0115, i.e., order 1 of 15. The RPON field of the remaining orders, 2 through 15, will contain the PON of the first order and the appropriate value in the NOR field -0215 through 1515. Maximum number of related orders will be determined based upon the definition of project rules related to RPON. The Project field will allow orders that are part of a project to be related to each other.
5. SUPs regarding order specific changes will not require reissue of the entire group of orders 01 through 15. Changes that affect all orders such as DD or the addition of an order will require reissue of the entire group of orders (i.e., the addition of an order(s), e.g., order number 16, would require reissue of the group of orders to change the value

in the NOR field (0116 through 1616)).

Cancellation of an order will not require a reissue of the group of orders. The cancellation of an order will not affect the NOR field, the status of the order will change to cancelled, but the order will remain as part of the group of orders, as a place holder. A cancelled order would be eliminated from the group of orders only if the entire group of orders were reissued, as in the case of the addition of order number 16 above.

DATA ENTRY CONDITIONS:

1. If the LSR:RPON is not populated and the LSR:NOR position 1 to 2 does not equal 01. Then Error.
2. If the LSR:RPON is populated and the LSR:NOR position 1 through 2 equals 01. Then Error.

- The format and structure of this field is defined by ANSI in document T1.238, Identification of Telecommunication Facilities for the North American Telecommunications System. The Facility Identifier consists of the following elements:
 - Facility Designation: A code that, for a specific type of facility, uniquely identifies a path between two network nodes.
 - Facility Type: A code that describes a type of facility when it is other than a single baseband channel on cable. Valid entries are outlined in Telcordia Technologies practice BR 795-450-100.
 - Channel/Pair/Time Slot: A code that identifies a specific assignable portion of a facility.
 - Location A: A standardized code that uniquely identifies the location of facility terminal A, which has the lower in alpha/numeric sequence of the two facility location codes. Valid values are outlined in Telcordia Technologies practice BR 795-100-100.
 - Location Z: A standardized code that uniquely identifies the location of facility terminal Z, which has the higher in alpha/numeric sequence of the two facility location codes. Valid values are outlined in Telcordia Technologies practice BR 795-100-100.

- The format and structure of this field is defined by ANSI in document T1.238, Identification of Telecommunication Facilities for the North American Telecommunications System. The Facility Identifier consists of the following elements:
 - Facility Designation - A code that, for a specific type of facility, uniquely identifies a path between two network nodes.
 - Facility Type - A code that describes a type of facility when it is other than a single baseband channel on cable. Valid entries are outlined in Telcordia Technologies practice BR 795-450-100.
 - Channel/Pair/Time Slot - A code that identifies a specific assignable portion of a facility.
 - Location A - A standardized code that uniquely identifies the location of facility terminal A, which has the lower in alpha/numeric sequence of the two facility location codes. Valid values are outlined in Telcordia Technologies practice BR 795-100-100.
 - Location Z - A standardized code that uniquely identifies the location of facility terminal Z, which has the higher in alpha/numeric sequence of the two facility location
